

Prepare your Data

In this guide, you will create the project directory on your computer, gather all data and place it in the project directory to be analyzed.

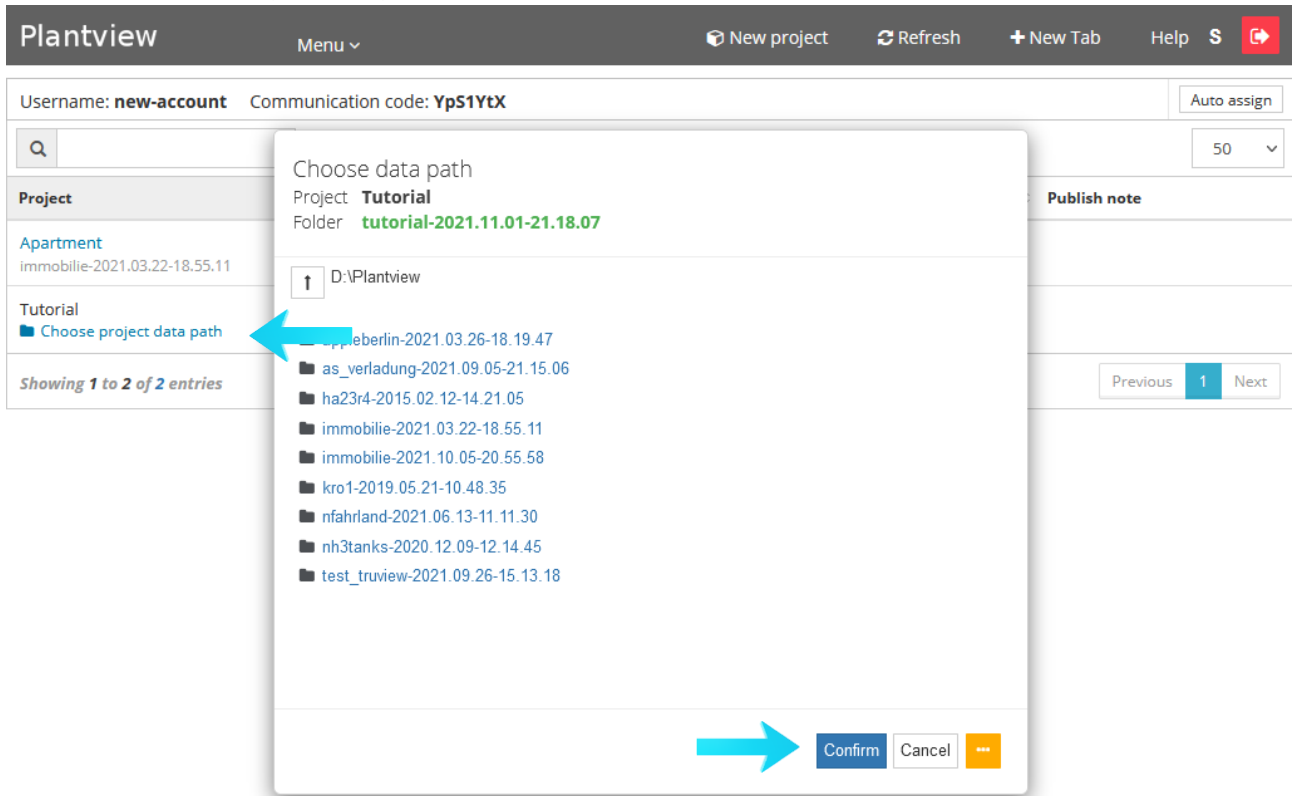

Use Plantview Workspace

1.

Press **Choose project data path** to choose where the project data path shall be created.

The unique folder name that will be created was defined during project creation (see Tutorial 2).

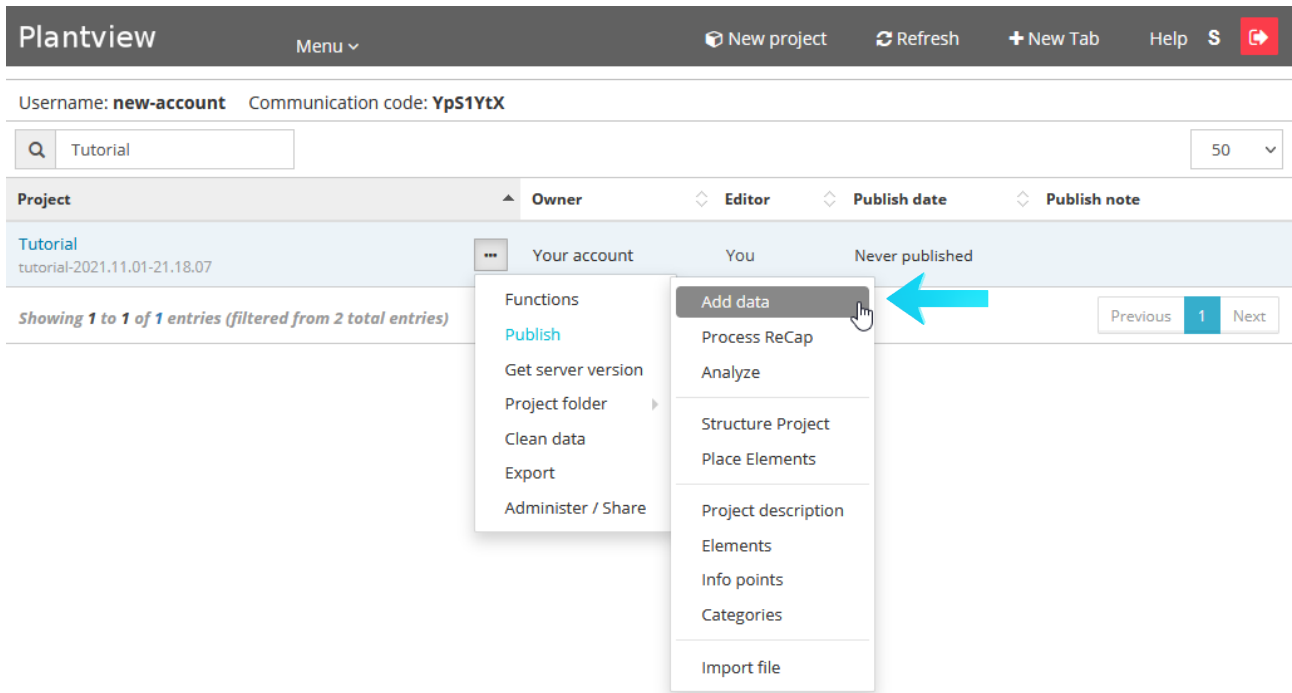

This is the location on your computer where the data will be located.

2.

The new project data folder has been created.

Press on **Functions/Add data** to open the project data folder in windows explorer.

3.

Place your data here organized in folders. You can use the suggested folders or create new ones.

Do not use subfolders.

Ignore the hidden system .cache folder.

Plantview will only process the supported formats.
